

ANSWERS

Chapter 3 Practice Quiz AAT

Use synthetic or long division for #1-3.

1. $(x^3 - 4x^2 + 2x + 5) \div (x - 2)$

$$\begin{array}{r} 2 | 1 & -4 & 2 & 5 \\ \downarrow & & 2 & -4 & -4 \\ \hline 1 & -2 & -2 & | 1 \\ \boxed{x^2 - 2x - 2 + \frac{1}{x-2}} \end{array}$$

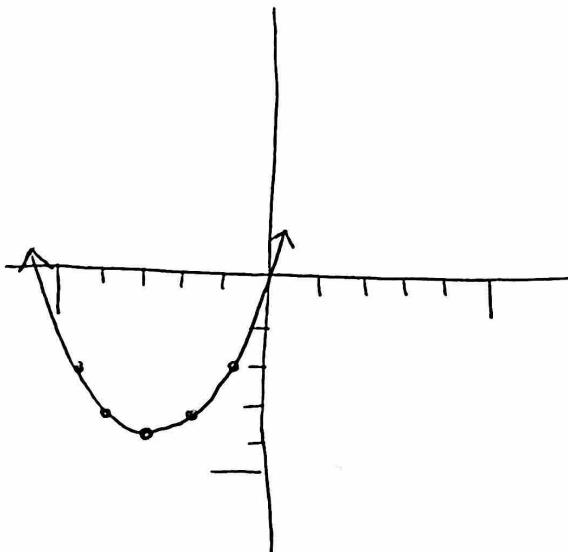

3. $(2x^3 + 4x^2 - 5) \div (x + 3)$

$$\begin{array}{r} -3 | 2 & 4 & 0 & -5 \\ \downarrow & -6 & 6 & -18 \\ \hline 2 & -2 & 6 & | -23 \\ \boxed{2x^2 - 2x + 6 + \frac{-23}{x+3}} \end{array}$$

5. Is $x - 4$ a factor of $12x^3 - 11x^2 + 9x + 18$? How do you know?

$$\begin{array}{r} 4 | 12 & -11 & 9 & 18 \\ \downarrow & 48 & 148 & 628 \\ \hline 12 & 37 & 157 & | 646 \leftarrow \text{no } R = 646 \end{array}$$

6. Graph $y = 0.5(x + 3)^2 - 4$

2. $(2x^3 + 7x^2 - 4x + 7) \div (x^2 + 2x - 1)$

$$\begin{array}{r} 2x+3 \\ x^2+2x-1 | 2x^3 + 7x^2 - 4x + 7 \\ \quad - 2x^3 + 4x^2 - 2x \\ \hline \quad \quad \quad 3x^2 - 2x + 7 \\ \quad \quad \quad - 3x^2 + 6x - 3 \\ \hline \quad \quad \quad -8x + 10 \end{array}$$

$$\boxed{2x+3 + \frac{-8x+10}{x^2+2x-1}}$$

4. Describe the transformations: $y = -6(x + 7)^2 - 1$

reflect over x-axis

V D U
L 7
D 1

7. Find the equation of the graph below:

$$y = a(x - 1)^2 + 4$$

$$5.04 = a(3 - 1)^2 + 4$$

$$1.04 = 4a$$

$$0.26 = a$$

$$\boxed{y = 0.26(x - 1)^2 + 4}$$

$$x^3 - 19x + 30$$

8. Fully factor ~~$x^3 - 14x + 29$~~ given that one factor is $x - 3$

31

	0	-19	30
↓	3	9	-30
<hr/>	1	-10	0

$$(x+5)(x-2)(x-3)$$

$$x^2 + 3x - 10$$

9. Fully factor $6x^3 + 7x^2 - 1$ given a root is $x = -\frac{1}{2}$

	6	7	0	-1
↓	-3	-2	1	
<hr/>	6	4	-2	0

$$6x^2 + 4x - 2$$

$$2(3x^2 + 2x - 1)$$

$$2(3\underbrace{x^2 + 3x}_{3x(x+1)} - \underbrace{x - 1}_{-(x+1)})$$

$$2(x+1)(3x-1)(x+\frac{1}{2})$$

10. The area for Johnny's farm uses the equation: $f(x) = -3x^2 + 125x + 12$ where x is the side length of the field. What should Johnny make the field side length be if he wants to *maximize* the area of the field?

$$x = -\frac{-125}{2(-3)} = \boxed{20.8}$$

a. What would the max area be?

$$f(20.8) = \boxed{1,314.08}$$

11. The cost equation for Mrs. Brown's new business is $c(x) = 4x^2 - 72x + 3$. How much should she try to pay for the tank tops she sells in order to *minimize* her cost?

$$x = \frac{-(-72)}{2(4)} = \boxed{\$9} \text{ tank top}$$
